LNG BACK IN PRODUCTION WITH HELIUM TO FOLLOW

Renergen is pleased to announce that the liquified natural gas plant is once again in operation following the repairs to the faulty conduction oil system which resulted in the Company taking the decision to halt operations in order to protect the helium and nitrogen modules. Since the repair work was undertaken, the system has been thoroughly tested, and the LNG system is now operational and producing LNG.

Commercial deliveries to both our customers' will commence later this week. The operations team will now focus on the remaining modules to allow the helium liquefaction module to be turned on. The helium separation and recovery module is providing high-levels of confidence with recovery exceeding design parameters.
