#### Orion Minerals Limited Incorporated in the Commonwealth of Australia Australian Company Number 098 939 274 ASX share code: ORN JSE share code: ORN ISIN: AU000000ORN1

Prieska Crown Pillar +105 Level Mineral Resource update results in improved definition and increased copper grade

- Updated Mineral Resource estimate completed for the +105m Level Crown Pillar supergene and hypogene sulphide zones at the Prieska Copper Zinc Mine in South Africa, incorporating all 2023 drilling data and geological data gathered during trial mining.
- Updated total supergene and hypogene sulphide Mineral Resource of: <u>1.1 Mt @ 2.8% Cu and 2.2%</u> <u>Zn</u> including an Indicated Resources of 0.8 Mt @ 2.84% Cu and 2.67% Zn and Inferred Resources of 0.3 Mt grading 2.6% Cu and 0.9% Zn.
- Improved definition of the mineralisation by separating out the higher grade more massive sulphide hangingwall unit for separate estimation has resulted in a 16% increase in the copper grade from 2.4% to 2.8%.
- Prieska's total Mineral Resource, reported and classified in accordance with the JORC Code (2012) is updated to <u>31 Mt grading 1.2% Cu and 3.6% Zn</u>.

# Orion's Managing Director and CEO, Errol Smart, commented:

"Our 2024 trial mining exercise has delivered great results with improved geotechnical data and detailed geological observations that allowed the Mineral Resource to be re-estimated with improved results for mine design purposes.

"While the trial mining was focussed on the supergene sulphide ore, we also gained valuable data on the footwall host geology and geotechnical conditions, and we also exposed over 250m strike extent of transitional ore that demonstrated the remarkable consistent quality of the underlying hypogene ore.

"Our DFS for PCZM, which will be reported shortly, is expected to demonstrate the commercial value of this improved understanding of the +105 block, which is being labelled as the Uppers Project in the DFS study."

Orion Minerals Limited (ASX/JSE: ORN) (Orion or Company) is pleased to advise that it has taken another key step in its early mining strategy at the Prieska Copper Zinc Mine (PCZM) in the Northern Cape, South Africa with the completion of an updated Mineral Resource estimate (MRE) for the supergene sulphide and remnant hypogene sections of the near-surface +105 Level Crown Pillar reporting a combined Indicated and Inferred Mineral Resource of 1.1 Mt grading 2.8% Cu and 2.2% Zn (Table 1).

The updated MRE is based on the incorporation of several additional holes drilled in 2023 and a reinterpretation of the geology by separating out the lower grade disseminated sulphides in the footwall unit from the higher-grade massive sulphide-dominated hangingwall unit made possible by extensive geological observation and data gathering during the trial mining program completed during Q1 and Q2 CY2024. The mining plan as part of the Definitive Feasibility Study (**DFS**) is focussed on the massive sulphide unit only.

The +105 Level Crown Pillar is located in close proximity to existing underground infrastructure and the northwestern section can be readily accessed via the trial mining underground infrastructure, allowing full scale mining activities to commence immediately with all required permits now in place.

The updated MRE for the +105 Level Crown Pillar brings the total Indicated and Inferred Mineral Resource including the Deep Sulphide Mineral Resource (refer ASX/JSE release 18 December 2018)<sup>1</sup> of the PCZM to **31 Mt grading 1.2% Cu and 3.6% Zn** (Figure 1, Table 3).

#### Updated +105m Level Crown Pillar Mineral Resource

The geological wireframe for the crown pillar has been updated to include additional drilling data from the 2023 reverse circulation (**RC**) drill campaign targeting metallurgical samples from the supergene sulphide zone and infilling of areas in the oxide zone. Geological mapping from the 2024 trial mining has also been used to modify the interpretation in this area.

Following an assessment of the trial mining information and drill hole data, there has been a review of the modelling parameters, resulting in separating out of the lower grade disseminated footwall unit from the hangingwall unit where higher grade massive sulphides dominate. This upper unit represents the planned mining cut in the mining plan to be reported in the DFS, with intended imminent release (Figure 2).

The MRE has been updated based on the additional drilling, geological mapping and observation in the trial mining, and resultant changes to the interpretation described above. This has resulted in changes to the MRE for the supergene sulphides and remnant hypogene zone from 1.3 Mt grading 2.4% Cu and 2.1% Zn (refer ASX/JSE release 25 July 2023) to 1.1 Mt grading 2.8% Cu and 2.2% Zn, including Indicated Resources of 0.8 Mt grading 2.84% Cu and 2.67% Zn and Inferred Resources of 0.3 Mt grading 2.6% Cu and 0.9% Zn. Significantly, while there is a 14% drop in the tonnage, the increase in copper grade results in the copper content remaining largely unchanged at approximately 30,000t.

The +105m Level Mineral Resources shown in Table 1 are based on drilling data available for the Prieska Copper Zinc Mine (previously Repli) Mining Right NC30/5/1/2/2/10138MR. The Mineral Resources are reported in accordance with the 2012 Edition of the Australian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves (**JORC Code (2012)**), with supporting information provided in Appendix 1, 2 and 3.

| Classification                     | Mineralised Zone   | Tonnes    | Cu<br>(tonnes) | Cu<br>(%) | Zn<br>(tonnes) | Zn<br>(%) |
|------------------------------------|--------------------|-----------|----------------|-----------|----------------|-----------|
|                                    | HW Oxide           | 200,000   | 1,000          | 0.48      | 2,000          | 0.90      |
|                                    | Oxide              | 490,000   | 4,000          | 0.81      | 4,000          | 0.73      |
| Indicated                          | Supergene Sulphide | 720,000   | 22,000         | 2.99      | 17,000         | 2.42      |
|                                    | Hypogene           | 80,000    | 1,000          | 1.43      | 4,000          | 5.00      |
|                                    | Total              | 1,500,000 | 28,000         | 1.86      | 27,000         | 1.79      |
|                                    | HW Oxide           | 30,000    | 100            | 0.4       | 300            | 1.0       |
|                                    | Oxide              | 300,000   | 3,000          | 1.0       | 2,000          | 0.8       |
| Inferred                           | Supergene Sulphide | 200,000   | 6,000          | 2.6       | 2,000          | 0.8       |
|                                    | Hypogene           | 50,000    | 1,000          | 2.7       | 700            | 1.4       |
|                                    | Total              | 600,000   | 10,000         | 1.8       | 5,000          | 0.9       |
| +105m Level Mineral Resource Total |                    | 2,100,000 | 38,000         | 1.8       | 32,000         | 1.5       |

Table 1: Global Indicated and Inferred Mineral Resource statement for the +105m Level Resource Block of the PCZM.

Note: +105m Level Mineral Resource oxide mineralisation interpretation wireframe cut-off = 0.3% Equivalent Cu (CuEq = Cu% + Zn%/2). Resource stated at 0.3% Cu cut-off.

+105m Level Mineral Resource supergene sulphide and remnant hypogene mineralisation interpretation wireframe cut-off = 0.8% Cu. Resources stated at 0.7% Cu cut-off.

Numbers may not add up due to rounding in accordance with the JORC Code (2012).

<sup>&</sup>lt;sup>1</sup> Mineral Resource reported in ASX release of 18 December 2018: "Landmark Resource Upgrade Sets Strong Foundation" available to the public on <u>www.orionminerals.com.au/investors/market-news</u>. Competent Person: Orion's Mineral Resource: Mr. Sean Duggan. Orion confirms it is not aware of any new information or data that materially affects the information included above. For the Mineral Resources, the Company confirms that all material assumptions and technical parameters underpinning the estimates in the ASX release of 18 December 2018 continue to apply and have not materially changed. Orion confirms that the form and context in which the Competent Person's findings are presented here have not materially changed.

Figure 1: Longitudinal schematic section showing the historically mined area and the +105m Level Mineral Resource (oxide zone, supergene sulphide and hypogene zones) at the PCZM, with the Deep Sulphide Mineral Resource.

Since the previous +105m Level MRE (refer ASX/JSE release 25 July 2023), 29 RC holes comprising 1,277m were targeted to intersect oxide mineralisation (Figure 4, Tables 2, 4, 5, 6). Two of these holes intersected the mineralisation deeper than anticipated in the supergene sulphide zone. Holes intersecting the oxide and leach zones were also used to modify the overall crown pillar interpreted geometry, which had an effect on the interpretation of the downdip trend into the supergene sulphide zone.

A further four RC holes comprising 345m were drilled for metallurgical samples from the supergene sulphide zone (Table 2). While these metallurgical holes were not sampled and assayed, logging and preliminary measurements from a handheld Niton XL3t 500 XRF analyser were used to further guide the geological interpretation in these areas.

In compliance with ASX Listing Rule 5.8.1, the following sections present a summary of all information material to understanding the reported Mineral Resource estimates:

# Geology & Geological Interpretation

The Prieska Cu-Zn Deposit is a volcanogenic massive sulphide (**VMS**) deposit which is situated in the southernmost exposures of the north-northwest trending Kakamas Terrain, which forms part of the Mid-Proterozoic Namaqualand Metamorphic Complex. The deposit is hosted by the Copperton Formation of the Areachap Group.

The structural sequence at the mine consists of a footwall Smouspan Gneiss Member, Prieska Copper Mines Assemblage, which hosts the sulphide mineralisation, and the hangingwall Vogelstruisbult Gneiss Member.

The +105m Level Resource occurs above the upper limit of the historically mined Prieska Cu-Zn Deposit at approximately 105m depth below surface, up to surface. It has a strike length of approximately 1km and thicknesses vary between 1.5m and 23m.

The +105m Level Resource Block comprises five defined zones (Figure 4).

- Haematite-goethite-quartz oxide zone (gossan) from surface to approximately 33m. A separate zone of elevated Cu and Zn values in the oxides in the hangingwall to the main +105m Level crown pillar is present in the northwest of the deposit for approximately 300m strike.
- Clay (kaolinite)/leach zone developed in places below 33m.
- Chalcocite dominant supergene sulphide zone between approximately 42m and 70m.
- Mixed supergene-hypogene sulphide zone between approximately 70m and 100m below surface. This has a relatively sharp contact with the underlying hypogene massive sulphides.

• Hypogene sulphide zone consisting of the unaltered, fresh massive sulphides.

The Mineral Resource update includes the supergene sulphide zone, the transition zone between the supergene sulphides and the hypogene, and the remnant hypogene above the historical stopes.

# **Drilling Techniques**

Drilling in the supergene sulphide and hypogene was undertaken during five distinct periods:

- Surface diamond drilling by the Anglovaal Group (Anglovaal) from 1968 to 1971;
- Surface diamond drilling by Repli full name (**Repli**) in 2012;
- Surface diamond drilling, surface RC drilling and underground diamond drilling by Orion in 2017;
- Underground diamond drilling by Orion in 2022; and
- Surface RC drilling by Orion in 2023.

A summary of the drilling is shown in the Table 2 below.

| Company   | Year      | No<br>Holes | Total<br>Metres | Drill Type     | Core Size      | Location  |
|-----------|-----------|-------------|-----------------|----------------|----------------|---|
| Anglovaal | 1968-1971 | 12          | 1,812           | Surface DD     | BQ             | +105m Level Block                                 |
| Repli     | 2012      | 11          | 785             | Surface DD     | NQ             | +105m Level Block                                 |
|           | 2017      | 27          | 3,173           | Surface DD     | NQ             | +105m Level Block                                 |
|           | 2017      | 20          | 1,297           | Surface RC     | 140mm diameter | +105m Level Block                                 |
|           | 2017      | 13          | 889             | Underground DD | NQ             | Supergene Sulphide Zone                           |
| Orion     | 2022      | 19          | 1,147           | Underground DD | NQ             | Supergene Sulphide Zone                           |
|           | 2023      | 4           | 345             | Surface RC     | 140mm diameter | Supergene Sulphide Zone<br>(metallurgical sample) |
|           | 2023      | 29          | 1,277           | Surface RC     | 140mm diameter | Oxide zone  |
| То        | tal       | 135         | 10,725          |                |                |   |

#### Table 2: Summary of drilling undertaken at +105m Level Resource Block of the PCZM.

Drilling of the original Anglovaal surface exploration holes was carried out at a 200m to 250m line spacing.

Repli and Orion drilling was carried out on approximately 25m-30m spaced lines along strike and at approximately 50m intervals. There were however holes drilled in between these lines. Underground holes, where possible, were spaced along 50m lines.

# Sampling and Sub – Sampling Techniques

For diamond drilling carried out by Anglovaal between 1968 and 1971, there is limited information available on sampling techniques for core. However, with exploration and resource management being carried out under the supervision of Anglovaal, it is considered by the Competent Person that there were likely procedures in place to the industry best practice standard at that time. This is based on the Competent Persons knowledge of exploration carried out by Anglovaal and discussions with personnel employed by Anglovaal.

- Anglovaal's mineral resource management was under the professional supervision of Dr Danie Krige, an internationally recognised expert of the time who published peer-reviewed papers based on the sampling data. The sampling was successful in defining a resource estimate which was used as the basis of successful mine development and operation over a 20-year period.
- Surface drill exploration samples were all sent to Anglovaal Research Laboratory at Rand Leases Mine.
- No records are available on the sampling methodology.
- Although no formal QA/QC samples were inserted at the time by the Anglovaal geologists on the exploration site or the mine, the Anglovaal Research Laboratory developed their own standards, certified by other commercial laboratories and those were used internally in the laboratory. Duplicate samples were also inserted to check for repeatability.

Sampling by Repli in 2012 and by Orion between 2017 and 2023 was carried out using industry-standard procedures:

• Diamond core was cut at the core yard, and half core was taken as the sample.

- In friable ore, where core splitting was not possible, half of the broken friable material was sampled using a spoon and scraper.
- Diamond core was sampled on 1m intervals where possible, sample lengths were adjusted to ensure samples did not cross geological boundaries or other features.
- RC samples were collected at 1m intervals via a cyclone and collected in poly weave bags. Each sample was split via a 3-tier splitter, followed by a single splitter to produce two samples of approximately 2.5kg each (an 'original' and a 'duplicate'). 2m compositing of zones outside the main identified mineralised zone was carried out in the 2023 oxide drilling program.
- Sampling was undertaken under the supervision of a qualified geologist and intervals were selected on the basis of mineralogy, textures and concentrations of specific minor minerals. A handheld Niton XRF instrument was used as guide during sampling.
- Samples were submitted for analysis to Genalysis South Africa (Pty) Ltd (Genalysis) (Repli) and ALS Chemex Pty Ltd (ALS) (Orion). Samples were pulverised in their entirety and split to obtain a 30g sample for digestion and analysis.
- Quality control samples were inserted under the direct supervision of a geologist at pre-determined points within the sampling stream.

# Sample Analyses

For Anglovaal, surface drill exploration samples were all sent to Anglovaal Research Laboratory at Rand Leases Mine.

- Atomic Absorption method was used with a Nitric-bromide digest.
- Although no formal QC samples were inserted with the drill samples, the Anglovaal Research Laboratory developed their own standards, certified by other commercial laboratories, and those were used internally in the laboratory. Duplicate samples were also inserted to check for repeatability.

For Orion and Repli, three laboratories were used to analyse samples. Repli used Genalysis and Orion used ALS with SGS Laboratory used as the referee laboratory.

- Analyses were done using acid digestion and the inductively coupled plasma and optical emission spectroscopy ("ICP-OES") methodology.
- Initially ALS used a three-acid digest but changed to an aqua-regia digest in November 2017. Genalysis used a four-acid digest. SGS used an aqua-regia digest.
- Quality control samples were inserted under the direct supervision of a geologist at pre-determined points within the sampling stream. Sample results of the duplicates and CRMs were examined on a regular basis by the responsible geologist and any discrepancy was taken up with the laboratories.
- CRM samples showed excellent accuracy and precision, and duplicate samples showed acceptable precision with no obvious bias. Blank samples indicated no contamination, within the pre-determined thresholds, during the sample preparation process.
- External laboratory checks between ALS and SGS were done by submission of duplicate samples. These showed excellent accuracy and precision.

# **Estimation Methodology**

The wireframe of the +105m Level Block used in the 2023 Mineral Resource update (refer ASX/JSE release 25 July 2023) was constructed utilising Cu% values greater than or equal to 0.3% and Zn% values greater than or equal to 0.6%. Surfaces were created to subdivide the mineralised zone into the various domains.

For the 2025 Mineral Resource update an additional surface was created for the supergene sulphide and hypogene zones delineating the contact between the footwall unit disseminated sulphides ("disseminated zone") and the hangingwall unit where massive sulphides ("massive zone") dominate. A 0.8% Cu cut-off was selected to model this surface based on an analysis of the sample population and a review of drill hole geological logging.

The resultant estimation domains for the disseminated and massive zones were not extrapolated any significant distance in the northwest but were terminated by the interpreted shallow dipping limits of the pitch of the mineralisation (Figure 4). In the southeast the mineralised zones were extrapolated approximately 80m beyond the last drill hole to where they intersect the sinkhole. The intersection of the mineralised body can be clearly observed on the northwest face of the sinkhole.

Samples were composited to 1m. The exceptionally high assay values for all variables were capped to selected thresholds using the Parker methodology. A block model with cells of 25m X by 25m Y by 2m Z was used for the supergene sulphide and hypogene zone, with a sub-cell size of 1m x 1m x 1m.

Data from the supergene sulphide and hypogene massive zones were analysed together with an interpreted 'soft boundary'. The same was done for the disseminated zone. Following a spatial analysis, the composite data was used to estimate the block grades for the massive zone using ordinary kriging (**OK**). For the disseminated zone, due to the lower density of sample data, block grades were estimated using a moving average estimate.

For the supergene sulphide and hypogene massive zones, neighbourhood analysis resulted in an optimum first pass search neighbourhood of 100m x 7.2m for local block estimation, corresponding to the variogram range. The second and third pass estimates were calculated from the pass 1 OK estimates using a moving average technique, with the search radii increased to 200m / 7m and 400m / 20m respectively. 80% of blocks were estimated by the first pass.

Bulk densities (t/m<sup>3</sup>) were determined using the water displacement method. There are 203 density measurements in the supergene sulphide and hypogene domain. The entire sample (normally 1m length) was measured, or where the formation was highly fractured, a shorter length was measured.

Local block estimates of density for the massive zone were produced using OK in areas of close-spaced sampling. A second pass with longer search radii was utilised and the remaining blocks were populated using grid filling. For the disseminated zone a zonal mean value of 2.59t/m<sup>3</sup> was applied to all blocks due to the lack of density data.

Datamine<sup>™</sup> was utilised to create a block model and measure individual block volumes within each zone and these data were imported into Isatis<sup>™</sup> for further geostatistical analysis.

The massive sulphides for the supergene sulphide and hypogene zones are reported separately in the Mineral Resource statement. The disseminated zone is all below the 0.7% Cu cut off.

#### **Resource Classification**

The geology of the two zones (massive and disseminated) making up the updated Mineral Resource is relatively uncomplicated, and the key issues relate to the delineation of the domain boundaries (not geology), and uncertainties in the interpretation where there is less data.

The massive zone of the supergene sulphide and hypogene domains is predominantly classified in the Indicated category with some areas in the Inferred category. There is a shallow pitch to the mineralisation in the northwest which marks the limit of the resource. In the southeast, 230m up to where the mineralisation intersects the sinkholes, there is less drilling and resulting uncertainties in the geometry of the mineralised zone, and this area has been classified as Inferred.

The disseminated zone has not been included in the Mineral Resource due to the lower density of data and because it is all below the cut-off grade for mine planning. However, the mineralised material will be included in future detailed mine scheduling as mining dilution.

For the massive zone, the geological model is defined to a reasonable level and there is sufficiently accurate data coverage to produce local block estimates using OK. In parts of the massive zone there are sufficient data for reasonably accurate local block estimates of grade (~80% of blocks populated by 1<sup>st</sup> pass kriging). Local block estimation for density with reasonable accuracy was possible. The kriging performance parameters, e.g. slope of regression, together with an assessment of the areas of blocks that were populated by 1<sup>st</sup> pass kriging, were utilised to make a distinction between the Indicated and Inferred classifications.

The results conform to the view of the Competent Person.

# Changes in +105m Level supergene sulphide and hypogene zone Mineral Resources

Given the changes in the interpretation of the supergene sulphide and hypogene mineralised domain, a direct comparison of updated and previous (2023) resource figures is difficult. However, the total tonnes (Indicated and Inferred classification categories) are 1.1*M*, which is a decrease from 1.3*M* tonnes in 2023. There is no notable change in the contained Cu tonnes. The contained Zn tonnes have decreased by 3,000t.

The 14% decrease in overall tonnes can be largely attributed to the exclusion of the lower grade disseminated footwall unit. There was an increase in estimated density from 2.94 tonnes per m<sup>3</sup> for the previously combined disseminated and massive zones to 3.00 tonnes per m<sup>3</sup> for the separated massive zone. The estimated density for the separated disseminated zone is 2.59 tonnes per m<sup>3</sup>. The separation of the disseminated footwall unit has resulted in an increase in copper grade of 16% in the massive unit. The overall copper content has not materially changed from the 2023 estimate. The zinc content is more significant in the excluded disseminated footwall unit, explaining the loss in 3,000 tonnes.

# Metallurgy

Mixed oxide, supergene and hypogene sulphide ore, including ore extracted from the +105 mineralised zone, was successfully treated by froth flotation to produce separate copper and zinc concentrates during historical production in the 1980s<sup>2</sup>.

Metallurgical tests conducted by Orion on supergene sulphide mineralisation at the Brisbane Metallurgical Laboratory in 2024 indicated the potential for producing a bulk concentrate. A simpler non-cyanide bulk concentrate flow sheet was proposed.

- Feed grind ~ 80% passing 75 microns
- Concentrate Grade >20.5% Cu
- Copper recovery >85%
- Mass pull to concentrate ~ 10 12.5 % m/m
- Feed Cu : Zn ratio be controlled above 1

The above parameters guided the plant design, utilising established technology for the 2025 Definitive Feasibility Study (**DFS**) study released contemporaneously with this report. Other recent tests indicated that the separation of copper and zinc from the concentrate was complex, resulting in increased reagent usage; consequently, this method was avoided.

#### **Cut-off Grades & Mining Methods**

The +105m Level supergene sulphide and hypogene zones Mineral Resource is reported above a 0.7% Cu cut off. This is based on calculated breakeven calculations as part of the DFS.

The mineralised envelope was interpreted based on a 0.8% Cu cut off. This was based on geological observations for the distinct lower grade disseminated footwall unit and the higher-grade hangingwall unit

<sup>&</sup>lt;sup>2</sup> Broekman B.R. and Penman D.W. The Prieska Experience: Flotation Developments in Copper-Zinc Separation. The Journal of South African Institute of Mining Metallurgy, volume 91, no. 8, Aug 1991, pp 257-265.

where more massive sulphides dominate (Figure 2). The two distinct units have two clear sample populations with a break at approximately 0.8% Cu. The massive sulphides occur as lenses but have been grouped together into the 'massive zone' to generate a viable domain for mineral resource estimation.

The proposed mining method in the DFS is long hole open-stoping (Figure 3). Stopes of dimensions 12m x 12m x 12m are planned with a 12m level spacing.

# Total Prieska Copper Zinc Mine Mineral Resource

The Deep Sulphide Mineral Resource of the Prieska Deposit, which was announced in December 2018 (refer ASX/JSE release 18 December 2018), combined with the +105m Level Mineral Resource is summarised in Table 3 below.

| Resource                         | Classification | Tonnes     | Cu<br>(tonnes) | Сu<br>(%) | Zn<br>(tonnes) | Zn<br>(%) |
|----------------------------------|----------------|------------|----------------|-----------|----------------|-----------|
| Doon Sulphido Bosouroo           | Indicated      | 19,000,000 | 220,000        | 1.17      | 670,000        | 3.60      |
| Deep sublide kesource            | Inferred       | 10,000,000 | 120,000        | 1.1       | 420,000        | 4.1       |

Table 3 Global Mineral Resource for the combined +105m Level and Deep Sulphide Mineral Resources of the PCZM<sup>1</sup>.

Note: Deep Sulphide Resource mineralisation interpretation wireframe cut-off = 3% Equivalent Zn (ZnEq = Zn% + Cu%x2). Resources stated at zero% Cu cut-off +105m Level Mineral Resource oxide mineralisation interpretation wireframe cut-off = 0.3% Equivalent Cu (CuEq = Cu% + Zn%/2). Resource stated at 0.3% Cu cut-off +105m Level Mineral Resource supergene sulphide and remnant hypogene mineralisation interpretation wireframe cut-off = 0.8% Cu. Resources stated at 0.7% Cu cut-off. Numbers may not add up due to rounding in accordance with the JORC Code (2012).

For and on behalf of the Board.

Errol Smart Managing Director and CEO

28 March 2025

#### **Competent Person's Statement**

The information in this report that relates to Exploration Results is based on information compiled by Mr Paul Matthews (Pr.Sci.Nat.), a Competent Person who is a member of the South African Council for Natural Scientific Professionals, a Recognised Professional Organisation (**RPO**). Mr Matthews is a full-time employee of Orion. Mr Matthews has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the JORC Code. Mr Matthews consents to the inclusion in this announcement of the matters based on his information in the form and context in which it appears.

The information in this report that relates to Mineral Resources is based on information compiled by Mr Sean Duggan, a Competent Person who is a Director and Principal Analyst at Z Star Mineral Resource Consultants (Pty) Ltd. Mr Duggan (Pr.Sci.Nat) is registered with the South African Council for Natural Scientific Professionals (Registration No. 400035/01), an RPO. Mr Duggan has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the JORC Code. Mr Duggan consents to the inclusion in this announcement of the matters based on his information in the form and context in which it appears.

# **Reference to Previous Reports**

The Deep Sulphide Mineral Resource was reported in ASX/JSE Release of 18 December 2018: "Landmark Resource Upgrade Sets Strong Foundation for Development of Prieska Zinc-Copper Project" available to the public on <a href="http://www.orionminerals.com.au/investors/asx-jseannouncements/">http://www.orionminerals.com.au/investors/asx-jseannouncements/</a>. Competent Person: Mr. Sean Duggan. Orion confirms it is not aware of any new information or data that materially affects the information related to the Deep Sulphide Mineral Resource included in the original market announcement. Orion confirms that all material assumptions and technical parameters underpinning the Deep Sulphide Mineral Resource in the ASX/JSE Release of 18 December 2018 continue to apply and have not materially changed. Orion confirms that the form and context in which the Competent Person's findings are presented here have not been materially modified from the original market announcement.

The +105 Level Mineral Resource (HW Oxide and Oxide) was reported in ASX/JSE Release of 25 July 2023: "Prieska Ahead Mineral Resource Increases of Trial Mining" available to the public on http://www.orionminerals.com.au/investors/asx-jseannouncements/. Competent Person: Mr. Sean Duggan. Orion confirms it is not aware of any new information or data that materially affects the information related to the +105 Level HW Oxide and Oxide Mineral Resources included in the original market announcement. Orion confirms that all material assumptions and technical parameters underpinning the +105 Level in the ASX/JSE Release of 25 July 2023 continue to apply and have not materially changed. Orion confirms that the form and context in which the Competent Person's findings are presented here have not been materially modified from the original market announcement.

# Disclaimer

This release may include forward-looking statements. Such forward-looking statements may include, among other things, statements regarding targets, estimates and assumptions in respect of metal production and prices, operating costs and results, capital expenditures, mineral reserves and mineral resources and anticipated grades and recovery rates, and are or may be based on assumptions and estimates related to future technical, economic, market, political, social and other conditions. These forward-looking statements are based on management's expectations and beliefs concerning future events. Forward-looking statements inherently involve subjective judgement and analysis and are necessarily subject to risks, uncertainties and other factors, many of which are outside the control of Orion. Actual results and developments may vary materially from those expressed in this release. Given these uncertainties, readers are cautioned not to place undue reliance on such forward-looking statements. Orion makes no undertaking to subsequently update or revise the forward-looking statements made in this release to reflect events or circumstances after the date of this release. All information in respect of Exploration Results and other technical information should be read in conjunction with Competent Person Statements in this release (where applicable). To the maximum extent permitted by law, Orion and any of its related bodies corporate and affiliates and their officers, employees, agents, associates and advisers:

- disclaim any obligations or undertaking to release any updates or revisions to the information to reflect any change in expectations or assumptions;
- do not make any representation or warranty, express or implied, as to the accuracy, reliability or completeness of the information in this release, or likelihood of fulfilment of any forward-looking statement or any event or results expressed or implied in any forward-looking statement; and
- disclaim all responsibility and liability for these forward-looking statements (including, without limitation, liability for negligence).

Figure 2: Typical stratigraphic column for the crown pillar area of the mineralised zone including an upper hangingwall unit dominated by massive sulphides, which forms the planned mining cut, and a lower footwall unit dominated by Zn-rich disseminated sulphides.

# Appendix 3: The following tables are provided in accordance with the JORC Code (2012) requirements for the reporting of Exploration Results and Mineral Resources for the Prieska Copper Zinc Mine +105 Level Resource.

Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

| Criteria            | JORC Code explanation  | Commentary   |
|---------------------|--|--|
| Sampling techniques | <ul> <li>Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc.). These examples should not be taken as limiting the broad meaning of sampling.</li> <li>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</li> <li>Aspects of the determination of mineralisation that are Material to the Public Report.</li> <li>In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information.</li> </ul> | <ul> <li>Drilling and sampling was undertaken during several distinct periods since the discovery of mineralisation. These are pre-mine exploration (1968-1971) surface diamond drill holes by Anglovaal Ltd (also known as the Anglovaal Group), (Anglovaal), surface diamond drilling by Repli in 2012 (Prieska Copper Zinc Mine (Pty) Ltd (PCZM) (formerly Repli Trading No. 27 (Pty) Ltd (Repli)), and surface and underground diamond drilling and reverse circulation (RC) drilling by Orion Minerals Ltd (Orion) (2017 to 2023). A total of 131 holes were drilled comprising 10,390m.</li> <li>12 surface diamond "V" holes totalling 1,812m were drilled by Anglovaal between 1968 and 1971.</li> <li>11 surface diamond holes totalling 785m were drilled by Repli in 2012.</li> <li>27 surface diamond holes totalling 3,173m were drilled by Orion in 2017.</li> <li>20 RC holes totalling 1,297m were drilled by Orion in 2017.</li> <li>13 underground diamond holes totalling 889m were drilled by Orion in 2017.</li> <li>19 underground diamond holes totalling 1,147m were drilled by Orion in 2022.</li> <li>29 RC holes totalling 1,286m were drilled by Orion in 2023.</li> <li>Orion acquired Repli in March 2017 and with the similar methodology utilised in the drilling and sampling processes by both companies, Repli and Orion commentary bar in the method rest part have provide and provide an</li></ul> |
|                     |  | Orion and Repli:   |
|                     |  | <ul> <li>Diamond core was cut at the core yard and half core was taken as the sample.</li> <li>In friable ore where core splitting was not possible half of the broken friable material was sampled using a spoon and scraper.</li> <li>Diamond core is sampled on 1m intervals where possible, sample lengths are adjusted to ensure samples do not cross geological boundaries or other features.</li> <li>RC samples were collected at 1m intervals via a cyclone and collected in polyweave bags. Each sample was split via a 3-tier splitter, followed by a single splitter to produce two samples of approximately 2.5kg each (an "original" and a "duplicate"). 2m compositing of zones outside the main</li> </ul>   |

| Criteria              | JORC Code explanation  | Commentary  |
|-----------------------|--|---|
|                       |  | <ul> <li>identified mineralised zone was carried out in the 2023 oxide drilling program.</li> <li>Sampling was undertaken under the supervision of a qualified geologist and intervals were selected on the basis of mineralogy, textures and concentrations of specific minor minerals. A handheld Niton XRF instrument was used as a guide during sampling. Quality control samples were inserted under the direct supervision of a geologist at predetermined points within the sampling stream.</li> <li>Samples were submitted for analysis to Genalysis South Africa (Pty) Ltd (Genalysis) (Repli) and ALS Chemex Pty Ltd (ALS) (Orion). Samples were pulverised in their entirety and split to obtain a 30g sample for digestion and analysis.</li> </ul>                                      |
| Drilling techniques   | <ul> <li>Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air<br/>blast, auger, Bangka, sonic, etc.) and details (e.g. core diameter, triple<br/>or standard tube, depth of diamond tails, face-sampling bit or other<br/>type, whether core is oriented and if so, by what method, etc.).</li> </ul>  | <ul> <li>Anglovaal:</li> <li>All mineralised intersections were by core drilling.</li> <li>BQ is recorded as the core size for V surface diamond drill holes.</li> <li>No record is available on core orientation. It is assumed the core was not oriented.</li> <li>Orion and Repli:</li> <li>In the near surface weathered zone HQ core was drilled.</li> <li>Core was not oriented.</li> <li>RC holes were drilled using a 140mm diameter RC hammer bit.</li> <li>Pre 2022 underground diamond drilling in the mineralised zone was drilled using a TBW coring bit and a double tube core barrel and BX size reverse flush in the country rock.</li> <li>2022 underground diamond drilling was NQ size using a triple tube core barrel to ensure good core recovery in soft formations.</li> </ul> |
| Drill sample recovery | <ul> <li>Method of recording and assessing core and chip sample recoveries<br/>and results assessed.</li> <li>Measures taken to maximise sample recovery and ensure<br/>representative nature of the samples.</li> <li>Whether a relationship exists between sample recovery and grade<br/>and whether sample bias may have occurred due to preferential<br/>loss/gain of fine/coarse material.</li> </ul> | <ul> <li>Anglovaal:</li> <li>All mineralised intersections were done with diamond core drilling.</li> <li>Core recoveries were measured for each drill "run" and recorded on assay sheets.</li> <li>In most holes, intersections were in hard rock and recoveries were generally good through the mineralisation.</li> <li>Orion and Repli:</li> <li>Mineralised intersections were done with diamond core drilling and reverse circulation (RC).</li> <li>Core stick-ups reflecting the depth of the drill hole were recorded at the</li> </ul>  |

| Criteria | JORC Code explanation   | Commentary   |
|----------|---|--|
|          |   | <ul> <li>rig at the end of each core run.</li> <li>A block with the depth of the hole written on it was placed in the core box<br/>at the end of each run.</li> <li>At the core yard, the length of core in the core box was measured for<br/>each run. The measured length of core was subtracted from the length of<br/>the run as recorded from the stick-up measured at the rig to determine<br/>the core lost.</li> <li>During surface drilling a triple tube core barrel was used to minimise the<br/>core loss in soft formations.</li> <li>In pre 2022 underground holes a TBW bit was used to optimise core<br/>recovery when drilling in the mineralised zone as opposed to reverse flush<br/>drilling in the footwall rocks.</li> <li>2022 underground diamond drilling was NQ size using a triple tube core<br/>barrel to ensure optimal core recovery in soft formations.</li> <li>Core loss was significant in some instances in the soft weathered<br/>formations (oxides, supergene sulphide ore and clay leach zones).</li> <li>Analysis of data shows that there is no relationship between core loss and<br/>grade.</li> <li>During RC drilling each metre is monitored on the drill string, with drilling<br/>stopped after every 1m advance to allow for full retrieval of sample and<br/>cleaning of return pipes, cyclone and splitter. Each sample retrieved per<br/>metre was weighed and recorded. Analysis of data shows there is no<br/>relationship between sample weight and grade.</li> </ul> |
| Logging  | <ul> <li>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</li> <li>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc.) photography.</li> <li>The total length and percentage of the relevant intersections logged.</li> </ul> | <ul> <li>Anglovaal:</li> <li>All relevant intersections have been logged and all of this information is available.</li> <li>Orion and Repli:</li> <li>RC drill chips were logged and recorded on standardised log sheets by a qualified geologist on 1m intervals using visual inspection of washed drill chips.</li> <li>Core of the entire hole length was geologically logged and recorded on standardised log sheets by a qualified geologist.</li> <li>Qualitative logging of colour, grain size, weathering, structural fabric, lithology, alteration type and sulphide mineralogy was carried out.</li> <li>Quantitative estimate of sulphide mineralogy was carried out.</li> <li>Samples have been logged to a level of detailed appropriate to support Mineral Resource estimation, mining studies and metallurgical studies.</li> <li>Logs were recorded at the core yard and entered into digital templates at the project office.</li> </ul>  |

| Criteria                       | JORC Code explanation   | Commentary   |
|--------------------------------|---|--|
|                                |   | <ul> <li>The Orion and Repli drill core were all (entire drill hole) photographed and saved in a dedicated folder.</li> <li>The Orion and Repli RC chips were all photographed as combined runs of 10m chip trays per photo.</li> </ul>  |
| Sub-sampling<br>techniques and | <ul> <li>If core, whether cut or sawn and whether quarter, half or all core<br/>taken.</li> <li>If non-core, whether riffled, tube sampled, retain split, etc. and</li> </ul>   | <ul><li>Anglovaal:</li><li>Details of sub-sampling techniques are not available. The Competent</li></ul>   |
| sample preparation             | <ul> <li>In homeone, when enhanced, hold sampled, hold y spin, etc. and whether sampled wet or dry.</li> <li>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</li> <li>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</li> </ul> | Person is satisfied with the quality of the historical data, and the associated<br>sample and sample preparation techniques, based on the results of a<br>comparative analysis between historical Anglovaal and recent Orion<br>drilling and sampling data. There is a reasonable compatibility between<br>the histograms for the two sets of data.  |
|                                | Measures taken to ensure that the sampling is representative of the in-<br>situ material collected including for instance results for field.  | Orion:   |
|                                | situ material collected, including for instance results for field<br>duplicate/second-half sampling.<br>• Whether sample sizes are appropriate to the grain size of the material<br>being sampled.  | <ul> <li>BQ and NQ core was cut at the core yard and half core was taken as a sample with a maximum of 1m sample length.</li> <li>With core samples, the entire sample length was cut and sampled. In runs where a geologist had assigned a duplicate sample (2% insertion rate), half core was quartered and sampled. Friable core inhibited a high percentage of quartering of core and duplicates were more from the pulp repeats.</li> <li>RC chip samples were split via a 3-tier splitter, followed by a single splitter to produce two samples of approximately 2.5kg each (an "original" and a "duplicate"). Riffle splitting of RC bulk samples was via an automatic rig mounted splitter or manually by experienced technicians supervised by site geologist.</li> <li>When wet, the chip samples were allowed to dry before it was split and sampled.</li> <li>Sample preparation was undertaken at ALS, an ISO accredited laboratory. ALS utilises industry best practise for sample preparation for analysis, involving drying of samples, crushing to &lt;5mm if required and then pulverising so that +85% of the sample passes 75 microns.</li> <li>Field duplicate samples showed acceptable precision with no obvious bias.</li> </ul> |
| Quality of assay data          | The nature, quality and appropriateness of the assaying and   | Anglovaal:   |
| and laboratory tests           | <ul> <li>Iaboratory procedures used and whether the technique is considered partial or total.</li> <li>For geophysical tools, spectrometers, handheld XRF instruments, etc., the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their</li> </ul>        | <ul> <li>Surface drill exploration samples were all sent to Anglovaal Research<br/>Laboratory at Rand Leases Mine.</li> <li>Atomic Absorption method was used with a Nitric-bromide digest.</li> <li>Although no formal QC samples were inserted with the drill samples, the<br/>Anglovaal Research Laboratory developed their own standards, certified</li> </ul>   |

| Criteria JORC Code explanation   | Commentary  |
|--|---|
| derivation, etc.<br>Nature of quality control procedures ad<br>duplicates, external laboratory checks)<br>levels of accuracy (i.e. lack of bias) and<br>established. | by other commercial laboratories, and those were used internally in the<br>laboratory. Duplicate samples were also inserted to check for<br>repeatability. No results are available for these QC samples.<br>• The Competent Person is satisfied with the quality of the historical data,<br>and the associated analytical techniques, based on the results of a<br>comparative analysis between historical Anglovaal and recent Orion<br>drilling and sampling data. There is a reasonable compatibility between<br>the histograms.  |
|  | Orion and Repli:  |
|  | <ul> <li>Two primary laboratories were used to analyse samples. Repli used Genalysis and Orion used ALS. Both laboratories have SANAS accreditation. However, Genalysis only has accreditation for Au and Pb. SGS Laboratory was used as the referee laboratory.</li> <li>Analyses were done using acid digestion and the inductively coupled plasma and optical emission spectroscopy ("ICP-OES") methodology.</li> <li>Initially, ALS used a three-acid digest but changed to an aqua-regia digest in November 2017. Genalysis used a four-acid digest. SGS used an aquaregia digest.</li> <li>Approximately 25% of the analysis of the samples was done using the three-acid digest out of 96 batches.</li> <li>For base metal analysis, a 3-acid digest (using HNO3, HCl, and HF) aims for near-total digestion, while aqua regia (a mixture of HCl and HNO3) is a partial digestion, while aqua regia (a mixture of HCl and HNO3) is a partial digestion method, primarily used for extracting metals from sulphide, carbonate, and some oxide minerals, but not as effective for silicate-bound metals.</li> <li>There was also a need to get the accurate content of Hg (mercury) as concentrates with Hg have a penalty liable and this is best done via Aqua Regia method. It was also to extract only sulphide bound minerals and not the silicate bound minerals.</li> <li>Quality control samples were inserted under the direct supervision of a geologist at pre-determined points within the sampling stream. Sample results of the duplicates and CRMs were examined on a regular basis by the responsible geologist and any discrepancy was taken up with the laboratories.</li> <li>CRM samples showed excellent accuracy and precision, and duplicate samples showed excellent accuracy and precision, and duplicate the samples showed excellent accuracy and sGS were done by submission of duplicates asmoples. These showed excellent accuracy and second prime and a start of the samples preparation process.</li> </ul> |

| Criteria                                    | JORC Code explanation   | Commentary   |
|---|---|--|
|   |   | precision, except for the Au as can be expected with the very low levels.  |
| Verification of<br>sampling and<br>assaying | <ul> <li>The verification of significant intersections by either independent or alternative company personnel.</li> <li>The use of twinned holes.</li> <li>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</li> <li>Discuss any adjustment to assay data.</li> </ul> | <ul> <li>Anglovaal: <ul> <li>No records are available on the verification of significant intersections.</li> <li>No adjustments have been made to the assay data.</li> </ul> </li> <li>Orion and Repli: <ul> <li>The drilling and sampling of each drilling campaign was supervised by experienced geologists.</li> <li>Core recovery, density data, sampling data and geological logs were documented in the core yard onto standard paper templates provided by the Company.</li> <li>Data entry from the primary hard copies was done on excel spreadsheets by the geologists logging the core and RC chips. The data was then imported into an Excel and Access database by the geologist responsible for the database. Validation of the data was done during the import process into the Access database by running queries, and also when the resource geologist imports the data into to the modelling software.</li> <li>All data has been migrated into a cloud based Datashed<sup>TM</sup> database.</li> <li>No adjustments have been made to the assay data.</li> </ul> </li> </ul> |
| Location of data points                     | <ul> <li>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</li> <li>Specification of the grid system used.</li> <li>Quality and adequacy of topographic control.</li> </ul>   | <ul> <li>Anglovaal:</li> <li>All surface hole collars were surveyed by qualified surveyors using a theodolite.</li> <li>The historical mine survey data is in the old national Lo 23 Clarke 1880 coordinate system.</li> <li>Downhole surveys were carried out for most of the V surface holes. Methodology of the downhole surveys is not recorded on the available hardcopy information but plans and sections are meticulously plotted and signed off by a certified surveyor.</li> <li>Both Eastman and Sperry Sun instruments were used in the downhole surveys.</li> <li>Significant deflections in the dips of the holes have been noted, especially for the deeper holes. V holes with no downhole surveys are shallower holes drilled earlier on in the initial exploration phase. These holes intersected areas where the mineralisation is now largely mined out.</li> <li>All hole positions have been converted to Lo23 WGS84 coordinates.</li> <li>Orion and Repli:</li> <li>Drill hole collar positions were laid out using a handheld GPS.</li> </ul>                            |

| Criteria  | JORC Code explanation  | Commentary  |
|---|--|---|
|   |  | <ul> <li>After completion of the Orion drilling, all collars were surveyed by a qualified surveyor using a Trimble R8 differential GPS.</li> <li>Downhole surveys for Orion were completed in all drill holes using a digital North-Seeking Gyro instrument. Repli diamond drill holes were surveyed downhole using a Reflex EZ Track multi-shot survey instrument.</li> <li>All survey data is in the WGS84 ellipsoid in the WG23 Zone with the Hartebeeshoek 1994 Datum. The coordinates are also supplied in Clarke 1880 and in UTM WGS84 Zone 34 (Southern Hemisphere).</li> </ul>  |
| Data spacing and  | <ul> <li>Data spacing for reporting of Exploration Results.</li> <li>Whether the data spacing and distribution is sufficient to establish the</li> </ul>   | Anglovaal:  |
| asinbonon   | degree of geological and grade continuity appropriate for the Mineral  | Original exploration V holes were drilled on a 200 - 250 m spacing.   |
|   | Resource and Ore Reserve estimation procedure(s) and classifications   | Orion and Repli:  |
|   | <ul> <li>Whether sample compositing has been applied.</li> </ul>   | <ul> <li>Drilling was carried out on approximately 25-30m spaced lines along strike and at approximately 50m intervals. There were, however, a few holes drilled in between these lines. Underground holes, where possible, were spaced on 50m spaced lines.</li> <li>Variography studies were carried out on the historical data set to determine the drill spacing for Mineral Resource estimates. The combined Orion, Repli and Anglovaal data spacing and distribution is considered sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</li> <li>No sample compositing has been applied before assaying on the core whilst some 2m composting was carried out in the RC program of 2023 by Orion, mostly in the fringes of the identified main mineralised zone.</li> </ul>  |
| Orientation of data in<br>relation to geological<br>structure | <ul> <li>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</li> <li>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</li> </ul> | <ul> <li>Most of the historical drilling and all current drilling was oriented perpendicular, or at a maximum achievable angle to, the attitude of the mineralisation.</li> <li>As a result, most holes intersect the mineralisation at an acceptable angle.</li> <li>For the southeast portion of the +105 resource, the presence of sinkholes on surface negates drilling from surface from the hangingwall.</li> <li>In this southeast area, several shallow angle surface drill holes were completed from the footwall of the mineralised zone. This resulted in suboptimal angles of intersection for some holes. The orientations of these holes are however, not considered of significance to the Mineral Resource estimation by the Competent Person.</li> <li>The southeast area was subsequently covered by underground 'up holes' from the footwall of the mineralised zone with intersections close to perpendicular to the mineralisation.</li> </ul> |

| Criteria          | JORC Code explanation   | Commentary   |
|-------------------|---|--|
|                   |   | <ul> <li>No sampling bias is anticipated as a result of hole orientations.</li> <li>EM surveys by Orion were completed in an orientation perpendicular to the interpreted or intersected mineralisation.</li> </ul>  |
| Sample security   | The measures taken to ensure sample security.                         | Anglovaal:   |
|                   |   | • No details of sample security are available. However, during the mining operations the site was fenced and gated with security personnel employed as part of the staff.  |
|                   |   | Orion and Repli:   |
|                   |   | <ul> <li>Access to drill sites are limited to responsible persons with close supervision of the unloading of the core tube and transportation of core to the core yards (Repli's in Kimberley and Orion's on site). Both core yards are enclosed by a security fence, the access gate of which was locked at all times when personnel were not on the premises.</li> <li>Sample shipments were controlled by the geologists and / or technicians. In the case of the Repli samples, geologists and technicians were responsible for the transportation of samples to the Genalysis laboratory in Johannesburg. Orion samples were sent with a courier service to the ALS laboratory in Johannesburg. Sample shipments were accompanied with appropriate sign off documentation to ensure all samples were received in good order.</li> <li>The chain of custody was managed by the individual Companies. Samples were stored on site in a secure locked building and then freighted directly to the laboratory.</li> <li>All coarse and pulp rejects returned from the laboratory are stored within secured locked buildings.</li> </ul> |
| Audits or reviews | The results of any audits or reviews of sampling techniques and data. | Anglovaal:   |
|                   |   | No records of audits or reviews are available.   |
|                   |   | Orion:   |
|                   |   | <ul> <li>Steffen, Robertson and Kirsten (South Africa) (Pty) Limited (SRK) reviewed the sampling techniques being practiced. One concern was regarding the suitability of spray lacquer used to seal porous samples for the determination of the relative density of oxide and supergene sulphide samples. This was addressed with the replacement of the spray lacquer with wax.</li> <li>A total of 33% of the samples lying within the wireframe used for the estimation of the supergene sulphide mineralisation were re-done for relative density using the wax relative density method. These results show</li> </ul>  |

| Criteria | JORC Code explanation | Commentary  |
|----------|-----------------------|---|
|          |                       | <ul> <li>excellent precision and no obvious bias when comparing with the original relative densities that were carried out using the spray lacquer method.</li> <li>RC chips and core from the +105 Block at the storage facilities has been visually examined by the Competent Person. Discussions have taken place with Repli on the conduct of the drilling programme, sampling techniques and handling of data and the Competent Person is satisfied that work was carried out to appropriate standards to classify and report the Mineral Resource in accordance with the JORC Code (2012).</li> </ul> |

# Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

| Criteria                                   | JORC Code explanation  | Commentary   |
|--|--|--|
| Mineral tenement and<br>land tenure status | <ul> <li>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</li> <li>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</li> </ul> | <ul> <li>Tenement Status:</li> <li>Mineral tenure in South Africa is regulated by the MPRDA, 2002, with the environmental aspects regulated by NEMA, 1998, both managed under the authority of the DMRE. The Project mineral tenure or tenement holding comprises a set of contiguous granted mining and prospecting rights surrounding the old PCM area: the Repli (PCZM) Mining Right, the Vardocube Mining Right, the Bartotrax Prospecting Right, the Repli-Doonies Pan Prospecting Right and four Orion Exploration No. 5 (Pty) Ltd granted prospecting rights. The primary tenement licenses are detailed below:</li> <li>PCZM (Repli) Mining Right:</li> <li>Mining Right: NC30/5/1/2/2/10138MR. The Repli Mining Right was granted on 23 August 2019 and executed on 11 December 2019, in terms of Section 23 of the MPRDA, 2002, over the previous Repli Prospecting Right area for copper, zinc, lead, silver, gold, sulphur, cobalt, barytes, limestone, stone aggregate, gravel, sulphur in pyrite, pyrite, molybdenum ore, tungsten ore, sand (general) and iron ore in respect of the farm Vogelstruis Bult No 104, portion RE25 and portion 26 and the farm Slimes Dam 154, in the Prieska District, Northern Cape Province for an initial period of 24 years which may be renewed for up to 30 years at a time. The Mining Right was awarded together with the pre-requisite EA and WML (granted 3 July 2019) and includes the approved Mining Works Program and the SLP.</li> </ul> |

| Criteria                          | JORC Code explanation   | Commentary  |
|-----------------------------------|---|---|
|                                   |   | • Orion effectively holds a 70% interest in the Project, with the remaining 30% as 20% BEE ownership, 5% community trust and 5% employee trust in compliance with Mining Charter 2018 guidelines and existing legislation.  |
|                                   |   | Vardocube Mining Right Application:   |
|                                   |   | <ul> <li>Mining Right: NC30/5/1/2/2/10146MR. The Vardocube Mining Right, in terms of Section 22 of the MPRDA, 2002, for the Vardocube Prospecting Right area for copper, zinc, lead, silver, gold, sulphur, cobalt, barytes, limestone, sulphur in pyrite, pyrite, molybdenum ore, tungsten ore, and iron ore was granted 14 August 2020 and executed 20 October 2020, together with the pre-requisite granted EA, approved, proposed Mine Works Program and the approved SLP which is entering its second 5-year cycle. The EA was granted on 3 March 2020.</li> <li>Vardocube is 100% held by PCZM and the Vardocube Mining Right is therefore held at the same 70:20:5:5 ratio as the PCZM Mining Right.</li> <li>The Mining Right covers the complete known strike of the +105 Level Resource.</li> <li>+105 Level Resource is located on Portion 26 of the farm Vogelstruis-Bult 104.</li> </ul>   |
| Exploration done by other parties | Acknowledgment and appraisal of exploration by other parties. | <ul> <li>The Anglovaal exploration resulted in the delineation and development of a large mine.</li> <li>The Repli exploration resulted in the first post Anglovaal delineation of the +105 Block resource</li> </ul>   |
| Geology                           | Deposit type, geological setting and style of mineralisation. | <ul> <li>The Copperton deposit is a Volcanogenic Massive Sulphide (VMS) deposit which is situated in the southernmost exposures of the north-northwest trending Kakamas Terrain, which forms part of the Mid-Proterozoic Namaqualand Metamorphic Complex.</li> <li>The deposit is hosted by the Copperton Formation of the Areachap Group. The Areachap Group, also hosts several other but smaller VMS deposits such as the Areachap, Boks Puts, Kantien Pan, Kielder, and Annex Vogelstruisbult deposits.</li> <li>The structural sequence at the mine consists of a footwall Smouspan Gneiss Member, Prieska Copper Mines Assemblage (PCMA), which hosts the sulphide mineralisation, and the hangingwall Vogelstruisbult Gneiss Member.</li> <li>The historically mined section of the deposit is confined to a tabular, stratabound horizon in the northern limb of a refolded recumbent synform, the axis of which plunges at approximately 5° to the south-east.</li> <li>The mineralised zone outcrop has a strike of 2,400m, is oxidised and / or</li> </ul> |

| Criteria                    | JORC Code explanation   | Commentary   |
|-----------------------------|---|--|
|                             |   | <ul> <li>affected by leaching and supergene enrichment to a depth of approximately 100m.</li> <li>The mineralised zone crops out as a well-developed gossan. It has a dip of between 55° and 80° to the northeast at surface and a strike of 130° to the north.</li> <li>The supergene sulphide zone of the +105 Block is the northernmost 1,000m portion of the total strike of the PCZM orebody. It is located from approximately 50m to 90m below surface between 1,020m and 980m AMSL.</li> <li>Trial mining on 99 Level has shown that the massive sulphide zone is composed of approximately 60% competent, albeit softer, altered equivalent of the hypogene sulphide and clayey material. According to drilling and exposure in raise development, the proportion of supergene sulphide zone in the trial mining area dips to the NE, at 40 to 55 degrees, and strike NW-SE. The mineralised zone varies in width from 1m to 8m.</li> </ul>  |
| Drill hole Information      | <ul> <li>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: <ul> <li>easting and northing of the drill hole collar</li> <li>elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar</li> <li>dip and azimuth of the hole</li> <li>down hole length and interception depth</li> <li>hole length.</li> </ul> </li> <li>If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</li> </ul> | <ul> <li>Anglovaal:</li> <li>Historical drilling results used in the +105 Block Mineral Resource estimation were reported in the ASX releases of 16 July 2018 and 18 November 2015.</li> <li>Orion and Repli:</li> <li>Drill hole intersections used in the +105 Mineral Resource estimation have been reported in the ASX release of 11 July 2022.</li> <li>Drill holes reported in this ASX release include 1,277m of RC drilling in 29 holes completed in 2023. An additional four holes comprising 345m were drilled for metallurgical samples and no assays are available.</li> <li>Collar and intersection information for these holes are included as Tables 4, 5 and 6 in Appendix 2.</li> <li>Other relevant diagrams have been included in the abovementioned ASX release relating to the drilling results at the Prieska Project.</li> <li>All drilling information is available and has been compiled digitally.</li> <li>A summary of the drill hole collar information related to the +105 Level Mineral Resource reporting has been provided in the above mentioned ASX release.</li> </ul> |
| Data aggregation<br>methods | <ul> <li>In reporting Exploration Results, weighting averaging techniques,<br/>maximum and/or minimum grade truncations (e.g. cutting of high<br/>grades) and cut-off grades are usually Material and should be stated.</li> </ul>  | <ul> <li>Anglovaal:</li> <li>Individual intersections were weighted by sample width.</li> <li>No truncations have been applied.</li> </ul>   |

| Criteria   | JORC Code explanation   | Commentary   |
|--|---|--|
|  | <ul> <li>Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</li> <li>The assumptions used for any reporting of metal equivalent values should be clearly stated.</li> </ul>                                     | <ul> <li>All grade and density information are incorporated in the Orion database, and due to the large number of intersections made it is in the Competent Person view that it should not be included in this reporting.</li> <li>Orion:</li> <li>Significant intersections for the +105 Level Supergene Sulphide Target previously reported to the ASX were calculated by average of assays result &gt; 0.3% copper or 0.5% zinc and weighted by the sample width and specific gravity of each sample.</li> <li>No truncations have been applied.</li> <li>No metal equivalent values were considered. Metal equivalent values were only used in the defining of the mineralisation wireframe interpretation as described in Section 3.</li> </ul> |
| Relationship between<br>mineralisation widths<br>and intercept lengths | <ul> <li>These relationships are particularly important in the reporting of Exploration Results.</li> <li>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.</li> <li>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known').</li> </ul> | <ul> <li>All intersection widths previously reported are down hole widths.</li> <li>Most holes intersected the mineralisation perpendicular or at high angle to the attitude of the mineralisation.</li> </ul>   |
| Diagrams   | <ul> <li>Appropriate maps and sections (with scales) and tabulations of<br/>intercepts should be included for any significant discovery being<br/>reported. These should include, but not be limited to a plan view of drill<br/>hole collar locations and appropriate sectional views.</li> </ul>  | <ul> <li>Historical drilling results were reported in the ASX releases of 16 July 2018 and 18 November 2015. Other relevant diagrams have been included in previous ASX releases relating to the drilling results at the Prieska Project.</li> <li>All prior drill hole intersections used in the +105 Supergene Sulphide Mineral Resource estimation have been reported in the ASX release of 11 July 2022.</li> </ul>  |
| Balanced reporting   | Where comprehensive reporting of all Exploration Results is not<br>practicable, representative reporting of both low and high grades<br>and/or widths should be practiced to avoid misleading reporting of<br>Exploration Results.  | <ul> <li>All drilling information was initially digitally available in a secure Geobank<sup>™</sup> database and has now been migrated into a secure cloud based DataShed<sup>™</sup> database.</li> <li>The Company has presented all available information in this report in a balanced manner and has provided appropriate context for the exploration results to allow a considered and balanced judgement of their significance.</li> </ul>   |
| Other substantive<br>exploration data                                  | Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.                               | <ul> <li>Hardcopy plans are available for a range of other exploration data. This includes mine survey plans, geological maps, airborne magnetic, ground magnetic, electromagnetic, gravity and induced polarisation information. All available exploration data has been viewed by the Competent Person.</li> <li>The Prieska Mine operated from 1972 to 1991 and is reported to have milled a total of 45.68 Mt of ore at a grade of 1.11% copper and 2.62%</li> </ul>   |

|              |   | <ul> <li>zinc, recovering 0.43 Mt of copper and 1.01 Mt of zinc. Detailed production and metallurgical results are available for the life of the mine.</li> <li>In addition, 1.76 Mt of pyrite concentrates and 8,403 t of lead concentrates as well as amounts of silver and gold were recovered.</li> <li>Copper and zinc recoveries averaged 84.9% and 84.3% respectively during the life of the mine.</li> <li>Comprehensive geotechnical work as part of the Definitive Feasibility Study (DFS) has been completed on the +105 Target area.</li> <li>Comprehensive metallurgical test work as part of the DFS has been completed on the +105 Target area.</li> <li>Relevant diagrams have been included in previous ASX releases relating to drilling at the Prieska Project.</li> </ul> |
| Further work | <ul> <li>The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step-out drilling).</li> <li>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</li> </ul> | <ul> <li>Infill drilling is required to upgrade the Inferred Mineral Resource in the<br/>southeast to Indicated.</li> </ul>   |

# Section 3 Estimation and Reporting of Mineral Resources

(Criteria listed in Section 1 and where relevant in Section 2. also apply to this section.)

| Criteria           | JORC Code explanation   | Commentary  |
|--------------------|---|---|
| Database integrity | <ul> <li>Measures taken to ensure that data has not been corrupted by, for example, transcription or keying errors, between its initial collection and its use for Mineral Resource estimation purposes.</li> <li>Data validation procedures used.</li> </ul> | <ul> <li>All drill hole and sample data are stored by Orion in a robust DataShed<sup>™</sup> database.</li> <li>Validation includes the following: <ul> <li>Ensuring that all drill holes have appropriate XYZ coordinates.</li> <li>Comparing the maximum depth of the hole against the final depth indicated in the collar file.</li> <li>Comparing the final depth in the survey file against final depth in the collar file.</li> <li>Comparing the final depths of all geology, assay, core recovery against the final depth in the collar file.</li> <li>Checking for duplicate drill holes.</li> <li>Checking that all fields that were set up as mandatory fields contain entries.</li> <li>The core recoveries were checked for unrealistic percentages.</li> <li>Density results are checked for unrealistic values.</li> </ul> </li> </ul> |

| Criteria                     | JORC Code explanation   | Commentary   |
|------------------------------|---|--|
|                              |   | the 3D modelling software. The data was validated for duplicates, gaps,<br>overlaps, impossible intervals in down-hole sequence for assay, collar<br>coordinates, geology data and survey data. The drill holes were also<br>visually checked in plan and section.   |
| Site visits                  | <ul> <li>Comment on any site visits undertaken by the Competent Person<br/>and the outcome of those visits.</li> <li>If no site visits have been undertaken indicate why this is the case.</li> </ul>   | <ul> <li>Z* Star Mineral Resource Consultants (Pty) Ltd (Z*) visited the Prieska Project from 17 to 19 October 2017.</li> <li>Z* Star subsequently updated the Mineral Resources for the +105 Target in 2019, 2023 and 2025.</li> </ul>  |
| Geological<br>interpretation | <ul> <li>Confidence in (or conversely, the uncertainty of) the geological interpretation of the mineral deposit.</li> <li>Nature of the data used and of any assumptions made.</li> <li>The effect, if any, of alternative interpretations on Mineral Resource estimation. The use of geology in guiding and controlling Mineral Resource estimation.</li> <li>The factors affecting continuity both of grade and geology.</li> </ul> | <ul> <li>The +105m Level Block model comprises six defined geological zones. These are: <ul> <li>Haematite-goethite-quartz oxide zone (gossan) from surface to approximately 33m;</li> <li>Clay (kaolinite)/leach zone developed in places below 33m;</li> <li>Chalcocite dominant supergene sulphide zone between approximately 42m and 70m;</li> <li>Mixed supergene sulphide zone between approximately 70m and approximately 100m below surface. This has a relatively sharp contact with the fresh underlying massive sulphides;</li> <li>Hypogene zone is the fresh underlying massive sulphides. This is limited to areas where the hypogene zone has not been mined up to the 105m Level; and</li> <li>A separate zone of elevated Cu and Zn values in the oxides (where there is adequate drilling information) in the hangingwall (HW) to the main +105m Level crown pillar is present in the northwest of the deposit or approximately 300m strike where the zone converges with the main zone towards the southeast.</li> </ul> </li> <li>All of the above six zones apart from the first (oxide) and second (clay/leach zone), are included in the Mineral Resource update. The Supergene Sulphide, Mixed and Hypogene Zone.</li> <li>The boundaries of the mineralisation are relatively sharp irrespective of the geology. A wireframe of the combined +105 Level crown pillar mineralisation was created by interpretation of the Cu and Zn values greater than or equal to 0.3% and Zn values greater than or equal to 0.3% and Zn values greater than or equal to 0.3% and Zn values as the zinc is leached out towards surface. In places, this resulted in the inclusion of mineralised areas based only on high Cu values.</li> </ul> |

| Criteria                               | JORC Code explanation  | Commentary   |
|--|--|--|
|  |  | <ul> <li>remodelled separating the footwall disseminated sulphides from the massive sulphides up to the HW. A 0.8% Cu cut off was used to separate the disseminated sulphides from the massive sulphides.</li> <li>Surfaces representing the top of the Supergene Zone and bottom of the Supergene Sulphide Zone were interpreted and modelled from drill hole data. A surface was created to represent the upper limit of underground stoping.</li> <li>Geological data and conclusions reached are based on observations in drill core.</li> <li>The disseminated sulphides and massive sulphides of the Supergene Sulphide &amp; Hypogene Zone are treated separately in the resource estimation.</li> </ul>  |
| Dimensions                             | <ul> <li>The extent and variability of the Mineral Resource expressed as<br/>length (along strike or otherwise), plan width, and depth below<br/>surface to the upper and lower limits of the Mineral Resource.</li> </ul>   | <ul> <li>The strike length of the +105 Level Crown Pillar mineralisation is approximately 1,000m from the northwest to where the zone intersects the sinkholes in the southeast. The depths below surface to the upper limits are approximately 50m and to the lower limits from 100m to 120m below surface.</li> <li>The thickness of the mineralised zone varies from 1.5m to 23m</li> </ul>   |
| Estimation and<br>modelling techniques | <ul> <li>The nature and appropriateness of the estimation technique(s) applied and key assumptions, including treatment of extreme grade values, domaining, interpolation parameters, and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen include a description of computer software and parameters used.</li> <li>The availability of check estimates, previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data.</li> <li>The assumptions made regarding recovery of by-products.</li> <li>Estimation of deleterious elements or other non-grade variables of economic significance (e.g. sulfur for acid mine drainage characterisation).</li> <li>In the case of block model interpolation, the block size in relation to the average sample spacing and the search employed.</li> <li>Any assumptions about correlation between variables.</li> <li>Description of how the geological interpretation was used to control the resource estimates.</li> <li>Discussion of basis for using or not using grade cutting or capping.</li> <li>The process of validation, the checking process used, the comparison of model data to drill hole data, and use of</li> </ul> | <ul> <li>The microless of the mineralised zone values from 1.5m to 25m.</li> <li>Density weighting is standard practice for VMS deposits. However, in the Supergene Sulphide &amp; Hypogene zones the density measurements do not correlate well with the assay values and density weighting was therefore not included. The poor correlation is probably due to the friable nature of the core.</li> <li>The distribution of composites for each of the variables (Cu, Zn, and density) were assessed and a decision was taken to utilise the Parker methodology for capping outliers. The process involved capping the relevant outliers for each variable to a chosen threshold.</li> <li>Capping was applied to seven Cu assays and four Zn assays in the Supergene Sulphide &amp; Hypogene Zone.</li> <li>Datamine<sup>TM</sup> was utilised to create a block model and measure individual block volumes within each zone and these data were imported into Isatis<sup>TM</sup> for further analysis.</li> <li>The Supergene Sulphide &amp; Hypogene zones were analysed independently to ensure that the plane for estimation had an optimal orientation.</li> <li>Variograms for all variables were created from the laboratory assay capped composites only and modelled in two directions, downhole (along the drill hole) and omni-directionally on the plane of the mineralisation. Assessment of the variogram models was preferentially focused on the Cu and Zn spatial structure.</li> <li>No mining production took place above the 105 level of the mine.</li> </ul> |

| Criteria           | JORC Code explanation  | Commentary   |
|--------------------|--|--|
|                    | reconciliation data if available.  | <ul> <li>No deleterious elements or non-grade variables were estimated.</li> <li>A block model was created to allow estimation into 25m x 25m x 2m blocks with sub-cells of 1m x 1m x 1m.</li> <li>OK was undertaken on all variables on a 25m x 25m x 2m block scale, utilising the capped composite input datasets and the modelled variograms. Estimation runs on two different neighbourhoods were utilised for all variables and the first estimation run in each case has smaller searches (equivalent to the variography and therefore the nature of the mineralisation is honoured and ensures that negative weights are minimised. The neighbourhood of the second kriging run was expanded to allow population of most of the remaining blocks. The 2nd pass kriging run failed to populate all the blocks in the Supergene Sulphide &amp; Hypogene Zone, particularly in areas where the peripheral dip of the deposit was different to the best fit plane. A decision was taken to utilise the "grid filling" option in Isatis™ using a moving average interpolator.</li> <li>For the Supergene Sulphide &amp; Hypogene domain, neighbourhood analysis resulted in an optimum search neighbourhood of 100m x 4.5m for local block estimation by OK, corresponding to the variogram range. The second and third pass estimates were calculated from the pass 1 OK estimates using a moving average technique with the search radii increased to 200m / 7m and 400m / 20m respectively. 80% of blocks were estimated by the first pass.</li> <li>The kriging performance parameters, e.g. slope of regression, together with an assessment of the areas of blocks that were populated by 1st pass kriging, were utilised to make a distinction between the Indicated and Inferred classifications.</li> <li>No assumptions were made regarding selective mining methods.</li> <li>The Supergene Sulphide &amp; Hypogene zones are reported independently in the Magral Besource statement</li> </ul> |
| Moisture           | Whether the tonnages are estimated on a dry basis or with natural moisture, and the method of determination of the moisture content. | <ul> <li>No moisture content was calculated, and the core was naturally dried<br/>when logged and sampled. The estimated tonnages are therefore based<br/>on a natural basis</li> </ul>  |
| Cut-off parameters | The basis of the adopted cut-off grade(s) or quality parameters     applied.   | The Mineral Resource is reported above a cut-off of 0.7% Cu which corresponds with the economic cut off generated from the Mine Plan as part of the DFS.   |

| Criteria                                | JORC Code explanation  | Commentary   |
|---|--|--|
| Mining factors or<br>assumptions        | <ul> <li>Assumptions made regarding possible mining methods, minimum<br/>mining dimensions and internal (or, if applicable, external) mining<br/>dilution. It is always necessary as part of the process of determining<br/>reasonable prospects for eventual economic extraction to consider<br/>potential mining methods, but the assumptions made regarding<br/>mining methods and parameters when estimating Mineral<br/>Resources may not always be rigorous. Where this is the case, this<br/>should be reported with an explanation of the basis of the mining<br/>assumptions made.</li> </ul>   | <ul> <li>A mine design for the supergene sulphide and hypogene zones<br/>incorporating long hole open stoping forms the basis of the DFS. 12m x 12m<br/>x 12m stopes are planned with levels at 12m intervals.</li> </ul>  |
| Metallurgical factors<br>or assumptions | <ul> <li>The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the metallurgical assumptions made.</li> </ul>   | <ul> <li>Metallurgical test work indicated that a separate copper and zinc concentrate of the supergene sulphide mineralisation is achievable.</li> <li>Ore extracted from the +105 mineralised zone was previously treated using froth flotation metallurgical process by Prieska Copper Mine. Mixed oxide, supergene and hypogene sulphide ore was successfully treated by froth flotation to produce separate copper and zinc concentrates during the 1980's.</li> <li>Metallurgical testwork has been completed as part of the upcoming DFS and will be reported accordingly.</li> </ul>   |
| or assumptions                          | <ul> <li>Assumptions induce regarding possible waste and process residue<br/>disposal options. It is always necessary as part of the process of<br/>determining reasonable prospects for eventual economic<br/>extraction to consider the potential environmental impacts of the<br/>mining and processing operation. While at this stage the<br/>determination of potential environmental impacts, particularly for a<br/>greenfields project, may not always be well advanced, the status of<br/>early consideration of these potential environmental impacts should<br/>be reported. Where these aspects have not been considered this<br/>should be reported with an explanation of the environmental<br/>assumptions made.</li> </ul> | Prieska Copper Mine site.  |
| Bulk density                            | <ul> <li>Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the frequency of the measurements, the nature, size and representativeness of the samples.</li> <li>The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, porosity, etc), moisture and differences between rock and alteration zones within the deposit.</li> <li>Discuss assumptions for bulk density estimates used in the evaluation process of the different materials.</li> </ul>   | <ul> <li>There are 203 density measurements in the Supergene Sulphide &amp; Hypogene Zone.</li> <li>Bulk densities were determined using the water displacement method. A representative sample of full core at 15cm length was collected per metre length, taking cognisance of the change in lithology.</li> <li>A total of 33% of the samples lying within the wireframe used for the estimation of the Supergene Sulphide mineralisation were re-done for relative density using the wax relative density method. These results showed excellent precision and no obvious bias when comparing with the original relative densities.</li> <li>No moisture content was determined.</li> <li>The density in the Supergene Sulphide &amp; Hypogene Zone was estimated</li> </ul> |

| Criteria                                      | JORC Code explanation  | Commentary   |
|---|--|--|
|   |  | using OK.  |
| Classification                                | <ul> <li>The basis for the classification of the Mineral Resources into varying confidence categories.</li> <li>Whether appropriate account has been taken of all relevant factors, i.e. relative confidence in tonnage/grade estimations, reliability of input data, confidence in continuity of geology and metal values, quality, quantity and distribution of the data.</li> <li>Whether the result appropriately reflects the Competent Person(s)' view of the deposit.</li> </ul>  | <ul> <li>The geology of the zones making up the +105m Level Mineral Resource is relatively uncomplicated, and the key issues relate to the delineation of the estimation domain boundaries (not geology). The assay data used for estimation is reliable and has been acquired with good governance associated with all processes. The variables were estimated using independent variogram models and OK.</li> <li>Inferred and Indicated Mineral Resources - the geological model is defined to a reasonable level and there is sufficiently accurate data coverage to produce local block estimates using OK. In parts of the Supergene Sulphide &amp; Hypogene Zone there are sufficient data for reasonably accurate local block estimates of grade (~80% of volume populated by 1st Pass kriging).</li> <li>The low number of density samples is a concern but local block estimation with reasonable accuracy was possible. The kriging performance parameters, e.g. slope of regression, together with an assessment of the areas of blocks that were populated by 1st pass kriging, were utilised to make a distinction between the Indicated and Inferred levels of confidence.</li> <li>The results conform to the view of the Competent Person.</li> </ul> |
| Audits or reviews                             | The results of any audits or reviews of Mineral Resource estimates.  | • To date the Mineral Resource estimate has only been reviewed internally by Orion. The review showed comparable results in terms of tonnage and grade distribution to an internal check estimate.   |
| Discussion of relative<br>accuracy/confidence | <ul> <li>Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate.</li> <li>The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.</li> <li>These statements of relative accuracy and confidence of the assumptions made and the procedures used.</li> </ul> | <ul> <li>Final estimates for all variables in both zones were validated by comparing the mean composite grades to the mean estimate grades. The data for Cu and Zn with the 1st Pass and final estimates are within 5% of the composites mean.</li> <li>Composite and estimated final grade and density distributions were compared to ensure that the block estimates represent the original data distribution. These were found to be reasonably compatible.</li> <li>Swathe Trend plots were created in the Y, X and Z directions and all the estimates followed the trend of the composite data.</li> <li>All estimates were studied graphically and compared to the composite data in three-dimensional space and they compared reasonably well, given the high variability of the sample data.</li> <li>No production data is available.</li> </ul>  |
